

Highlights

- Bazett QTc misrepresents pediatric cardiac risk in opposite directions by drug class
- Genuine repolarization change at therapeutic exposure is small, max 11.5 ms
- Bazett over-flags 29 of 84 combinations versus 5 by genuine change, $r = \text{minus } 0.34$
- Uncorrected action potential duration recovers true effect for rate-changing drugs
- Mechanistic model concords weakly with pediatric FAERS, AUC 0.55 to 0.62
